

Abstract of the Disclosure

This invention describes a novel methodology for using a multiple page dialog field for setting sound tasks in a communication device such a mobile device or a mobile phone. According to the present invention, the dialog/sounds are divided into multiple pages (“tabs”), for example, Ringing tones page, Message tones page, Alarms page, etc. The sounds are placed to different pages according to their purposes. The right page is opened using a setting page means which can be implemented as a default setting depending on from where the dialog is opened. However, if the user wishes to select a ringing tone sound from another page, e.g., the “message tone page”, it is allowed and possible to do by going directly to that page from the previous page. Every page has a no-tone selection as well.
